

ABSTRACT OF THE DISCLOSURE

A desired range of moving image data is designated. Then, still images obtained from a start frame and an end frames in the designated range are displayed, and an interface for designating trimming areas is provided for the two frames. The trimming areas are set in a predetermined frame to be extracted from the designated range based on the trimming areas designated by using the interface. The predetermined number of frames is extracted from the designated range of the moving image data, a partial image in the set trimming areas is extracted from the extracted predetermined number of frames, and a predetermined number of continuous still images are generated. The obtained continuous still image is printed onto a recording sheet via a printing device.
